

# Blogging with a single org-file

Mario Román

*<2018-08-15 Wed 23:19>*

This blog is generated by a single org-file which can be found [here](#). The file contains some org-babel elisp blocks that export the HTML files, create the index and populate the RSS feed. This is possible using **tags** that signal whether any specific header is a post, **properties** that store the name and the html direction of the articles, and the **org-map-entries** function, which maps a function over all headers.
