

Hom is continuous and then all right adjoints are

Mario Román

<2018-12-23 Sun 16:20>

This is an exercise on Samson Abramsky's notes on the course Categories, Proofs and Processes. [AT10]

Statement. *Let A be an object in the category \mathcal{C} . Show that the covariant hom functor $\mathcal{C}(A, -)$, as defined in Lecture III, preserves all limits.*

Proof. Let \mathcal{I} be a small category, $F: \mathcal{I} \rightarrow \mathcal{C}$ a functor and let L with the morphisms $(l_I)_{I \in \mathcal{I}}$ be the limit of that functor. We know that for every morphism $i: I \rightarrow J$ in \mathcal{I} , we have $l_J = Fi \circ l_I$.

Let Z be a set with a family of morphisms $f_I: Z \rightarrow \mathcal{C}(A, FI)$ determining a cone to $\mathcal{C}(A, F-): \mathcal{I} \rightarrow \mathbf{Sets}$; that is, such that for each $i: I \rightarrow J$ in \mathcal{I} , we have that $f_J = (Fi \circ -) \circ f_I$; or, in other words, for each $z \in Z$ we have $f_J(z) = Fi \circ f_I(z)$. Thus, fixing any $z \in Z$ gives as a family of morphisms $f_I(z) \in \mathcal{C}(A, FI)$ defining a cone. This implies that there exists some unique morphism $a(z): A \rightarrow L$ such that $l_I \circ a(z) = f_I(z)$.

Repeating this for every $z \in Z$ we have obtained a function $a: Z \rightarrow \mathcal{C}(A, L)$ with the property $l_I \circ a = f_I$. This function must be the unique one with this property, because for any other $a': Z \rightarrow \mathcal{C}(A, L)$, for each $z \in Z$ we would have $l_I \circ a'(z) = f_I(z)$ and that would imply that $a'(z) = a(z)$. \square

Proposition 1. *Right adjoints preserve limits.*

Proof. (From [Awo10]) Let $L: \mathbb{C} \rightarrow \mathbb{D}$ and $R: \mathbb{D} \rightarrow \mathbb{C}$ be a pair of adjoints $L \dashv R$. Let X_i be objects determining any diagram and Y an arbitrary object. We have the following chain of natural transformations between hom-sets.

$$\begin{aligned} \text{hom}(Y, R \lim X_i) &\cong \text{hom}(LY, \lim X_i) \\ &\cong \lim \text{hom}(LY, X_i) \\ &\cong \lim \text{hom}(Y, RX_i) \\ &\cong \text{hom}(Y, \lim RX_i) \end{aligned}$$

By Yoneda Lemma, $R \lim X_i \cong \lim RX_i$. \square
